

Applying an Oracle APEX Patch — APEX 26.1

PSE Bundle Patch Procedure (Multi-PDB Environment)

Overview

As of APEX 18.1+, minor version fixes are delivered as Patch Set Exception (PSE) Bundles rather than the legacy `apxpatch.sql` process. PSE bundles are applied via `catpatch.sql` and are cumulative — each new bundle supersedes the previous one.

Prerequisites

- Take a full DB/PDB backup or guaranteed restore point before patching.
- Confirm downtime window — APEX will be briefly unavailable during patch apply.
- Download the correct PSE Bundle patch number for APEX 26.1 from My Oracle
- Test in a non-production PDB first when possible.

1. Check Current Patch Level

```
SELECT patch_version, installed_on
FROM apex_patches
WHERE patch_number = 39179920
ORDER BY installed_on;
```

2. Apply the Patch via SQL*Plus

```
cd /path/to/patch_dir
sqlplus / as sysdba
```

For a multi-PDB setup, switch container first:

```
ALTER SESSION SET CONTAINER = <pdb_name>;
@catpatch.sql
```

Review `catpatch.log` for errors before proceeding.

3. Update Static Resources (Images/CSS/JS)

Recommended long-term fix — sync patch images to your standard APEX images directory:

```
cp -r /u01/other/patch/39179920/images/* /u01/other/apex/images/
```

Then point ORDS back to the standard static path:

```
/u01/other/ords/bin/ords --config /u01/other/ords config set standalone.static.path /u01/other/apex/images
sudo systemctl restart ords
```

4. Verify the Patch

```
SELECT patch_version, installed_on
FROM apex_patches
WHERE patch_number = 39179920
ORDER BY installed_on;
```
